Maximal-sum Subarray (Problem 3.7)

- ▶ Array $A[1 \cdots n], a_i \geq 0$
- ▶ To find (the sum of) an MS in A

$$A[-2, 1, -3, \boxed{4, -1, 2, 1}, -5, 4]$$

$$O(n)$$

$MSS[i]$: the sum of the MS *ending with* a_i or 0

$$mss = \max_{1 \leq i \leq n} MSS[i]$$

$$MSS[i] = \max \{MSS[i - 1] + a_i, 0\}$$

Q : Where does the $MSS[i]$ start?

$$MSS[0] = 0$$

```
1: procedure MSS( $A[1 \cdots n]$ )
2:    $\text{MSS}[0] \leftarrow 0$ 
3:   for  $i \leftarrow 1$  to  $n$  do
4:      $\text{MSS}[i] \leftarrow \max \{ \text{MSS}[i-1] + A[i], 0 \}$ 
5:   return  $\max_{1 \leq i \leq n} \text{MSS}[i]$ 
```

```
1: procedure MSS( $A[1 \cdots n]$ )
2:    $\text{mss} \leftarrow 0$ 
3:    $\text{MSS} \leftarrow 0$ 
4:   for  $i \leftarrow 1$  to  $n$  do
5:      $\text{MSS} \leftarrow \max \{ \text{MSS} + A[i], 0 \}$ 
6:      $\text{mss} \leftarrow \max \{ \text{mss}, \text{MSS} \}$ 
7:   return  $\text{mss}$ 
```

Ulf Grenander $O(n^3) \implies O(n^2)$

Michael Shamos $O(n \log n)$, onenight

Jon Bentley Conjecture: $\Omega(n \log n)$

Michael Shamos Carnegie Mellon seminar

Jay Kadane $O(n)$, ≤ 1 minute

Sorting

Definition (K -sorting (Problem 6.8))

An array $A[1 \cdots n]$ is *k -sorted* if it can be divided into k blocks, each of size n/k (we assume that $n/k \in \mathbb{N}$), such that the elements in each block are larger than the elements in earlier blocks and smaller than elements in later blocks. The elements within each block need *not* be sorted.

$$n = 16, k = 4, \frac{n}{k} = 4$$

1, 2, 4, 3; 7, 6, 8, 5; 10, 11, 9, 12; 15, 13, 16, 14

k -sorted

1-sorted \rightarrow 2-sorted \rightarrow 4-sorted $\rightarrow \dots \rightarrow n$ -sorted

Quicksort (with median as pivot) stops after the $\log k$ recursions.

$$\Theta(n \log k)$$

$$\Omega(n \log k)$$

$$L = \binom{n}{n/k, \dots, n/k} = \frac{n!}{((\frac{n}{k})!)^k}$$

$$H \geq \log \left(\frac{n!}{((\frac{n}{k})!)^k} \right)$$

$$n! \sim \sqrt{2\pi n} \left(\frac{n}{e}\right)^n \implies \log n! \sim n \log n$$

Bolts and Nuts (Problem 6.9)

Quicksort

$$A(n) = O(n \log n)$$

In the worst case:

- ▶ “Matching Nuts and Bolts” by Alon *et al.*, $\Theta(n \log^4 n)$
- ▶ “Matching Nuts and Bolts Optimality” by Bradford, 1995, $\Theta(n \log n)$

$$\Omega(n \log n)$$

$$3^H \geq L \geq n! \implies H \geq \log n! \implies H = \Omega(n \log n)$$

Searching

Repeated Elements (Problem 2.12)

$$R[1 \dots n]$$

$$\# > \lfloor \frac{n}{13} \rfloor$$

To find all $\frac{n}{13}$ -repeated elements

$$\text{check}(R[i], R[j])$$

$$\# \text{ of } \frac{n}{13}\text{-repeated elements} \leq 13$$

x is a $\frac{n}{13}$ -repeated element

$$\implies x \text{ is a } \frac{n}{26}\text{-repeated element of } R[1 \dots \frac{n}{2}] \text{ or } R[\frac{n}{2} + 1 \dots n]$$

Divide and Conquer Algorithm

$$T(n) = 2T\left(\frac{n}{2}\right) + O(n)$$

$$Q : k \leftarrow 2$$

$$Q : 13 \rightarrow k$$

$$T(n) = 2T\left(\frac{n}{2}\right) + O(kn)$$

$$k : O(n \log k)$$

$$\Omega(n \log k)$$

$Q : \exists$ a repeated element?

$L : \#$ of leaves?

“Finding Repeated Elements” by Misra & Gries, 1982

Maxima of a Point Set (Problem 6.15)

$$(x_1, y_1) \succ (x_2, y_2) \iff x_1 > x_2 \wedge y_1 > y_2$$

$$x\text{-sorting, } \max y \implies O(n \log n)$$

Wrong Divide and Conquer Algorithms

x -median & y -median

$$T(n) = T\left(\frac{3}{4}n\right) + O(n) \implies T(n) = O(n)$$

$$T(n) = 3T\left(\frac{1}{4}n\right) + O(n) \implies T(n) = O(n)$$

Divide and Conquer Algorithm

x -median

$$T(n) = 2T\left(\frac{n}{2}\right) + O(n)$$

$$\Omega(n \log n)$$

Smallest Missing Positive Integer (Problem 9.6)

Sorted array $A[1 \dots n]$

$$a_i \in \mathbb{Z}^+$$

$$\forall i \neq j : a_i \neq a_j$$

$$A = [1, 2, 4, 5] \implies 3$$

$$T(n) = O(n)$$

$$O(\log n)$$

$$T(n) = T\left(\frac{n}{2}\right) + 1$$

Local Minimum (Problem 9.12)

$$A[1 \cdots n]$$

$$A[0] \geq A[1] \wedge A[n-2] \leq A[n-1]$$

$$A[i-1] \geq A[i] \leq A[i+1]$$

\exists

$$\text{Scan} : T(n) = O(n)$$

$$\min A : T(n) = O(n)$$

Local Minimum (Problem 9.12)

$$A[1 \cdots n]$$

$$A[0] \geq A[1] \wedge A[n-2] \leq A[n-1]$$

$$A[i-1] \geq A[i] \leq A[i+1]$$

$$m = \frac{n}{2}$$

$$T(n) = O(\log n)$$

$$A[m-1] \geq A[m] \leq A[m+1]$$

$$T(n) = T\left(\frac{n}{2}\right) + 1$$

$$A[m-1] < A[m] \vee A[m+1] < A[m]$$

$$n = 1 \quad \vee \quad n = 2$$

Searching in Matrix (Problem 9.8)

$$M : m \times n$$

Row: increasing from left to right

Col: increasing from top to down

$$x \in M?$$

Divide & Conquer

$$T(m, n) = 3T\left(\frac{m}{2}, \frac{n}{2}\right) + 1$$

Always checking the lower left corner.

$$T(m, n) = m + n - 1$$

Assume $M : n \times n$

$$W(n) \leq 2n - 1$$

$$W(n) \geq 2n - 1$$

By Adversary Argument!

Diagonals: $i + j = n - 1$ & $i + j = n$

No particular ordering requirements on these two diagonals!

$$i + j \leq n - 1 \implies x > M_{ij}$$

$$i + j > n - 1 \implies x < M_{ij}$$

$A + B = c$ (Problem 9.9)

Sorted $S[1 \cdots n]$, c

$\exists A, B : A + B = c?$

$O(n)$

Left-right-pointers iteration

$$S_i + S_j \geq < c$$

Selection

The k -th Largest Elements in a Heap (Problem 7.2)

$$k \ll n$$

$$T(k)$$

Must be in the first k layers $\implies O(2^k)$

The Largest k Elements (Problem 8.5)

$$O(n \log n)$$

sorting

$$O(n + k \log n)$$

max-heap

$$O(n + k \log k)$$

k -selection + **partition** + sorting

Selecting k Elements Close to the Median (Problem 8.6)

$$S = \{800, 6, 900, 50, 7\}, \quad k = 2 \implies \{6, 7\}$$

$$O(n \log n + k)$$

sorting + left-right iteration

$$O(n + k \log k)$$

median-selection + the smallest k elements

Selecting the Median of 5 Elements using 6 Comparisons (Problem 8.2)

Step 5: there are 2 possible cases

Step 6: there are 4 possible cases, done

Sorting 5 Elements using 7 Comparisons

Step 5: there are 2 possible cases

Step 6: there are 3 possible cases

Step 7: sorted

Amortized analysis is
an algorithm analysis technique for
analyzing a sequence of operations
irrespective of the input to show that
the average cost per operation is small, even though
a single operation within the sequence might be expensive.

The Summation Method

$$o_1, o_2, \dots, o_n$$

$$c_1, c_2, \dots, c_n$$

$$\forall i, \hat{c}_i = \frac{\left(\sum_{i=1}^n c_i \right)}{n}$$

The Summation Method for Array Doubling

On **any sequence** of n INSERTs on an **initially empty** array.

$$\begin{array}{lcl} o_i : & o_1 & \textcolor{red}{o_2} \quad \textcolor{red}{o_3} \quad o_4 \quad \textcolor{red}{o_5} \quad o_6 \quad o_7 \quad o_8 \quad \textcolor{red}{o_9} \quad o_{10} \\ c_i : & 1 & \textcolor{red}{2} \quad \textcolor{red}{3} \quad 1 \quad \textcolor{red}{5} \quad 1 \quad 1 \quad 1 \quad \textcolor{red}{9} \quad 1 \end{array}$$

$$c_i = \begin{cases} (i-1) + 1 = i & \text{if } i-1 \text{ is an exact power of 2} \\ 1 & \text{o.w.} \end{cases}$$

$$\sum_{i=1}^n c_i \leq n + \sum_{j=0}^{\lceil \lg n \rceil - 1} 2^j = n + (2^{\lceil \lg n \rceil} - 1) \leq n + 2n = 3n$$

$$\boxed{\forall i, \hat{c}_i = 3}$$

The Accounting Method

$$O_1, O_2, \dots, O_n$$

$$c_1, c_2, \dots, c_n$$

$$a_1, a_2, \dots, a_n$$

$$\hat{c}_i = c_i + a_i, \quad a_i \geq 0$$

Amortized Cost = Actual Cost + Accounting Cost

$$\forall n, \sum_{i=1}^n c_i \leq \sum_{i=1}^n \hat{c}_i \implies \forall n, \sum_{i=1}^n a_i \geq 0$$

Key Point: Put the accounting cost on specific objects.

The Accounting Method for Array Doubling

$Q : \hat{c}_i = 3 \text{ vs. } \hat{c}_i = 2$

$$\hat{c}_i = 3 = \underbrace{1}_{\text{insert}} + \underbrace{1}_{\text{move itself}} + \underbrace{1}_{\text{help move another}}$$

| | \hat{c}_i | c_i (actual cost) | a_i (accounting cost) |
|--------------------|-------------|---------------------|-------------------------|
| INSERT (normal) | 3 | 1 | 2 |
| INSERT (expansion) | 3 | $1 + t$ | $-t + 2$ |

Simulating a queue Q using two stacks S_1, S_2 (Problem E3)

procedure ENQ(x)

Push(S_1, x)

procedure DEQ()

if $S_2 = \emptyset$ **then**

while $S_1 \neq \emptyset$ **do**

Push($S_2, \text{Pop}(S_1)$)

Pop(S_2)

The Summation Method for Queue Simulation

$$\frac{\left(\sum_{i=1}^n c_i \right)}{n}$$

The operation sequence is *NOT* known.

The Accounting Method for Queue Simulation

| | | | | |
|--------------|-----------------|----------------|-----------------|----------------|
| <i>item:</i> | Push into S_1 | Pop from S_1 | Push into S_2 | Pop from S_2 |
| | 1 | 1 | 1 | 1 |

$$\hat{c}_{\text{ENQ}} = 3$$

$$\hat{c}_{\text{DEQ}} = 1$$

$$\sum_{i=1}^n a_i \geq 0 \iff \sum_{i=1}^n a_i = \#S_1 \times 2$$

The Accounting Method for Queue Simulation

$$\hat{c}_{\text{ENQ}} = 3$$

$$\hat{c}_{\text{DEQ}} = 1$$

$$\#S_1 = t$$

| | \hat{c}_i | c_i (<i>actual cost</i>) | a_i (<i>accounting cost</i>) |
|----------------------------------|-------------|------------------------------|----------------------------------|
| ENQUEUE | 3 | 1 | 2 |
| DEQUEUE ($S_2 = \emptyset$) | 1 | 1 | 0 |
| DEQUEUE ($S_2 \neq \emptyset$) | 1 | $1 + 2t$ | $-2t$ |

Thank
You!
